

# Building with Dredged Material and/or Sediments

- Hard work done over the last years/decades to improve the reuse of sediment and dredged materials
  - *in a wide range of applications*
  - *taking into account different legislations*

Sédimateriaux = nice example of many actors working together on this aspects, resulting in the very interesting Ceamas project
- (User friendly) decision support systems can help to decide which kind of reuse is most appropriate regarding the characteristics of the sediment – suitability index for different applications
- New kinds of reuse came in the picture: agricultural amendment (Lift of Lowlands), aggregates...

**Speakers have proven that dredged material can be a valuable alternative resource!**
