SENSING SOIL & WATER

# The source of anorganic sediment

Soil erosion

# Evaluation of erosion and sediment transport

- Projects of the Flemish Environmental Agency and the Environmental Department of the Flemish Government
- Executed by Fluves and KU Leuven
- Modeling
  - Sediment transport to waterways
  - Evaluating the effect of erosion control measures
- Measuring
  - Calibrating model
  - Getting more system knowledge

Curve Number Model

Discharge  
=  $f(\text{time, space})$

WaTEM/SEDEM  
Total Sedimentload  
=  $f(\text{space})$

SEDIGRAM  
Sedimentconcentrations  
=  $f(\text{time, space})$

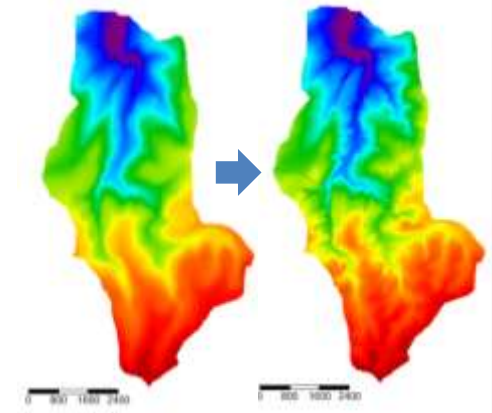

# WaTEM-SEDEM

- Developed at KUL (Verstraeten et al., 2002)
- Based on RUSLE
  - $Erosion = R * K * LS * C * P$
- Transporting sediment through landscape
  - $Transportcapacity (TC) = kTc * R * K * LS$
- If amount of sediment < TC: Erosion
- If amount of sediment > TC: Sedimentation

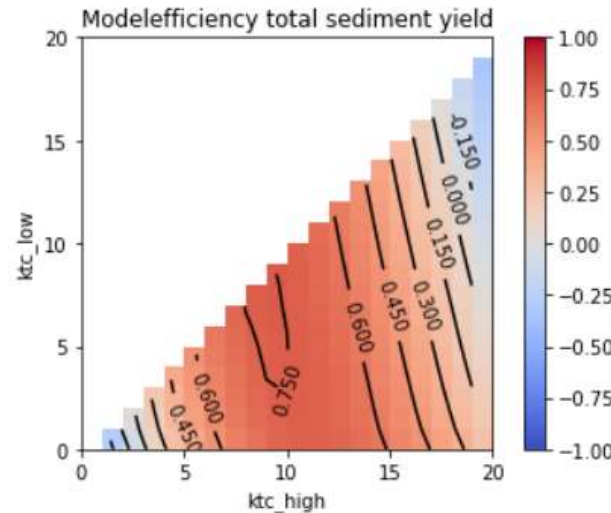

# WaTEM-SEDEM 2.0

- New source data:
    - High Resolution DEM (LiDAR)
    - Detailed land-use data
    - Detailed information about crops
    - Updated R-factor → climate change
  - Python toolbox
    - Automatically creating input data from source data
    - Post-processing of model results
  - Model code was reviewed and debugged
- ➔ Calibration necessary

# Calibration

- Sediment measurements in small catchments/ivers
  - Turbidity + water sampling
- Dredged sediment volumes in sedimenttraps
- 43 datasets, 26 used for calibration

# Illustration: Input maps

- Catchment of Langegracht (830 ha)

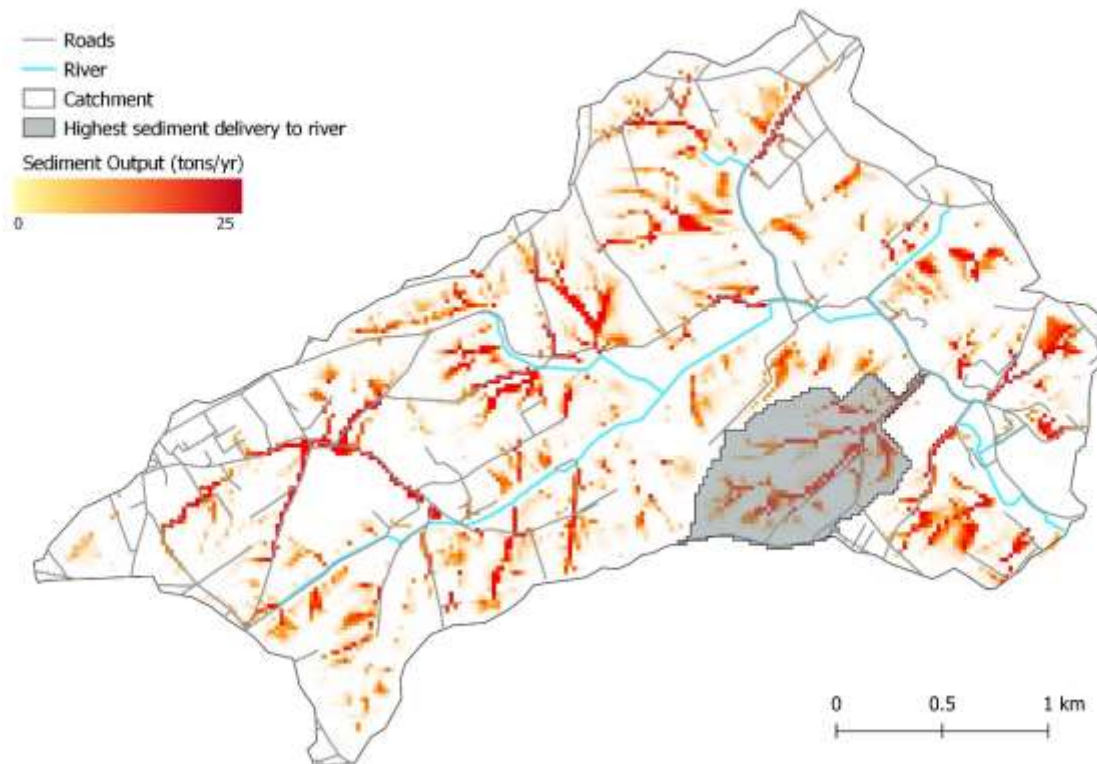

# Illustration: Output maps

# Identifying areas with high sediment input

# Event-based monitoring

IoT Network of pluviometers on dams

RTK GPS measurements

# Continuous monitoring system
